

## Exercise 2.5: Django MVT Revisited

### Learning Goals

- Add images to the model and display them on the frontend of your application
- Create complex views with access to the model
- Display records with views and templates

### Reflection Questions

1. In your own words, explain Django static files and how Django handles them.

Static files are files that don't change dynamically in the application, like CSS, images and JavaScript and are usually provided by the developer during the creation of the project. You store them in their own static folder and access them through your html pages using the `{% load static %}` command.

2. Look up the following two Django packages on Django's official documentation and/or other trusted sources. Write a brief description of each.

Package	Description
ListView	A page representing a list of objects that are usually what the view is operating on.
DetailView	While this view is executing, <code>self.object</code> will contain the object that the view is operating

3. You're now more than halfway through Achievement 2! Take a moment to reflect on your learning in the course so far. How is it going? What's something you're proud of so far? Is there something you're struggling with? What do you need more practice with? You can use these notes to guide your next mentor call.

I need more practice with all of it. I have a hard time keeping track of all the steps necessary to create the views, templates, etc in the lessons. Conceptually I'm still pretty unclear about the overall schematic.
